Outline

The Standard Model of Particle Physics

Weak bosons mix the different generations of quarks via the CKM matrix, but this does not happen for leptons. This property of the model is known as **lepton flavor universality (LFU)**.
The Standard Model of Particle Physics

Weak bosons mix the different generations of quarks via the CKM matrix, but this does not happen for leptons. This property of the model is known as **lepton flavor universality (LFU)**.

However, recent measurements of the $R(D)$ and $R(D^*)$ ratios show a deviation from the SM predictions. This could be a hint of **lepton flavor violation (LFV)** and then **new physics beyond the SM**.

BSM Signatures on the Di-Tau Channel at the LHC
LFV and τ lepton as window to new physics

In the different models, we can have different production mechanisms.
For example, resonant ones
or non-resonant ones
Different Models could have one or several contributions to the di-tau channel, and the **interference between them could be relevant.**

Example: The Vector Leptoquark Model

A leptoquark is defined as a particle with a vertex that mix vectors and quarks.

If U_1 is a vector leptoquark that preserves the chirality on the vertex, we expect an interaction term like

$$\sim U_1^\mu \bar{q}_L \gamma_\mu \ell_L,$$

and these allows a similar interaction term for the right handed currents

$$\sim U_1^\mu \bar{d}_R \gamma_\mu e_R.$$

Where the SM charges for the leptoquark, in the $Y = 2(Q - T_3)$ convention, are

	$\bar{q}_L$	ℓ_L^j	$\bar{q}_L \gamma_\mu \ell_L$	U_1^μ
U(1)	$-1/3$	-1	$-4/3$	$+4/3$
SU(2)	$\bar{\mathbf{2}}$	$\mathbf{2}$	$\mathbf{1}$	$\mathbf{1}$
SU(3)	$\bar{\mathbf{3}}$	$\mathbf{1}$	$\bar{\mathbf{3}}$	$\mathbf{3}$

Then, the leptoquark $U_1 \sim (\mathbf{3}_C, \mathbf{1}_I, 4/3_Y)$, and its covariant derivative is

$$\mathcal{D}_\mu U_\nu = \left(\partial_\mu + i g_s T^a G_\mu^a + i \frac{2}{3} g' B_\mu \right) U_\nu.$$

Introduction   Example: The 4321-Model   Final Remarks

The model

The Vector Leptoquark Lagrangian

The full Lagrangian for the vector leptoquark is

$$\mathcal{L}_U = -\frac{1}{2} U_{\mu\nu}^\dagger U^{\mu\nu} + M_U^2 U_\mu^\dagger U^\mu$$

$$- ig_s \left(1 - \kappa_c\right) U_\mu^\dagger T^a U_\nu G_a^{\mu\nu} - \frac{2i}{3} g' \left(1 - \kappa_Y\right) U_\mu^\dagger U_\nu B^{\mu\nu}$$

$$+ \frac{g_U}{\sqrt{2}} \left[U_1^\mu \left(\beta_L^{ij} \bar{q}_L^i \gamma_\mu e_L^j + \beta_R^{ij} \bar{d}_R^i \gamma_\mu e_R^j \right) + \text{ h.c. } \right]$$

where $U_{\mu\nu} = \mathcal{D}_\mu U_\nu - \mathcal{D}_\nu U_\mu$, $\mathcal{D}_\mu = \partial_\mu - ig_s G_\mu^a T^a - i\frac{2}{3} g_Y B_\mu$, and the couplings β_L and β_R are complex 3×3 matrices in flavor space.

The Vector Leptoquark Lagrangian

The full Lagrangian for the vector leptoquark is

$$
\mathcal{L}_U = -\frac{1}{2} U^{\dagger}_{\mu\nu} U^{\mu\nu} + M_U^2 U^{\dagger}_\mu U^\mu
$$
$$
- i g_s (1 - \kappa_c) U^{\dagger}_\mu T^a U_\nu G_a^{\mu\nu} - \frac{2i}{3} g' (1 - \kappa_Y) U^{\dagger}_\mu U_\nu B^{\mu\nu}
$$
$$
+ \frac{g_U}{\sqrt{2}} \left[U_1^\mu \left(\beta_L^{ij} \bar{q}_L^i \gamma_\mu e_L^j + \beta_R^{ij} \bar{d}_R^i \gamma_\mu e_R^j \right) + \text{h.c.} \right]
$$

where $U_{\mu\nu} = \mathcal{D}_\mu U_\nu - \mathcal{D}_\nu U_\mu$, $\mathcal{D}_\mu = \partial_\mu - i g_s G_\mu^a T^a - i \frac{2}{3} g_Y B_\mu$, and the couplings β_L and β_R are complex 3×3 matrices in flavor space.

The $\Delta F = 2$ and constrains on lepton flavor violating processes indicates an structure as

$$
\beta_L = \begin{pmatrix} 0 & 0 & \beta_L^{13} \\ 0 & 0 & \beta_L^{23} \\ 0 & \beta_L^{32} & \beta_L^{33} \end{pmatrix}, \quad \beta_R = \text{diag}\left(0, 0, \beta_R^{33}\right)
$$

If U_1 has a gauge origin $\kappa_c = \kappa_Y = 0$. We choose $U(2)$ in quark and leptons space, in a way that you have an hierarchy, $|\beta_L^{31}| \ll |\beta_L^{23}|$, $|\beta_L^{32}| \ll |\beta_R^{33}|$, $|\beta_L^{33}| = \mathcal{O}(1)$.

Sensitivity Reach of the U_1 Leptoquark
Sensitivity Reach of the U_1 Leptoquark

$S_T^{\text{meT}} = \left| \vec{p}_T^{\,\text{miss}} \right| + \sum_i \left| \vec{p}_T^{\,i} \right|$
Non-resonant production is highly dependent on the couplings, so it dominates the regions of high coupling constants at all masses.

Take care, you could need a Z' boson

Defining

$$\psi_L^{\text{SM}} = \begin{pmatrix} q_{Lr} \\ q_{Lg} \\ q_{Lb} \\ \ell_L \end{pmatrix} \implies \mathcal{L}_{\text{int}} \sim U_{1\alpha}^\mu \, \bar\psi_L^{\text{SM}} \, \gamma_\mu \, T_+^\alpha \, \psi_L^{\text{SM}} + \text{h.c.}, \quad T_+^\alpha = \begin{pmatrix} 0 & 0 & 0 & \delta_{r\alpha} \\ 0 & 0 & 0 & \delta_{g\alpha} \\ 0 & 0 & 0 & \delta_{b\alpha} \\ 0 & 0 & 0 & 0 \end{pmatrix},$$

we have six generators $T_\pm^\alpha$ with closure relation,

$$\sum_\alpha \left[T_+^\alpha, T_-^\alpha \right] = 3 T_{B-L} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & -3 \end{pmatrix}.$$

So, the gauge group with this leptoquark must include a $U(1)_{B-L}$ symmetry.

Take care, you could need a Z' boson

Defining

$$\psi_L^{\text{SM}} = \begin{pmatrix} q_{Lr} \\ q_{Lg} \\ q_{Lb} \\ \ell_L \end{pmatrix} \implies \mathcal{L}_{\text{int}} \sim U_{1\alpha}^\mu \, \bar{\psi}_L^{\text{SM}} \, \gamma_\mu T_+^\alpha \psi_L^{\text{SM}} + \text{h.c.}, \quad T_+^\alpha = \begin{pmatrix} 0 & 0 & 0 & \delta_{r\alpha} \\ 0 & 0 & 0 & \delta_{g\alpha} \\ 0 & 0 & 0 & \delta_{b\alpha} \\ 0 & 0 & 0 & 0 \end{pmatrix},$$

we have six generators $T_\pm^\alpha$ with closure relation,

$$\sum_\alpha \left[T_+^\alpha, T_-^\alpha \right] = 3 T_{B-L} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & -3 \end{pmatrix}.$$

So, the gauge group with this leptoquark must include a $U(1)_{B-L}$ symmetry.
The generator T_{B-L} is associated with the $U(1)_{B-L}$ symmetry with a Z' boson.

$$\mathcal{L}_{\text{int}} \sim Z'_\mu \left(\bar{\psi}_L^{\text{SM}} \gamma^\mu (3 T_{B-L}) \psi_L^{\text{SM}} \right)$$

$$\sim Z'_\mu \left(\bar{q}_L \gamma^\mu q_L - 3 \bar{\ell}_L \gamma^\mu \ell_L \right).$$

Sensitivity Reach of the U_1 Leptoquark

Take care, you could need a Z' boson

Defining

$$\psi_L^{\mathrm{SM}} = \begin{pmatrix} q_{Lr} \\ q_{Lg} \\ q_{Lb} \\ \ell_L \end{pmatrix} \implies \mathcal{L}_{\mathrm{int}} \sim U_{1\alpha}^\mu \, \bar{\psi}_L^{\mathrm{SM}} \, \gamma_\mu T_+^\alpha \psi_L^{\mathrm{SM}} + \mathrm{h.c.}, \quad T_+^\alpha = \begin{pmatrix} 0 & 0 & 0 & \delta_{r\alpha} \\ 0 & 0 & 0 & \delta_{g\alpha} \\ 0 & 0 & 0 & \delta_{b\alpha} \\ 0 & 0 & 0 & 0 \end{pmatrix},$$

we have six generators $T_\pm^\alpha$ with closure relation,

$$\sum_\alpha \left[T_+^\alpha, T_-^\alpha \right] = 3T_{B-L} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & -3 \end{pmatrix}.$$

So, the gauge group with this leptoquark must include a $U(1)_{B-L}$ symmetry.
The generator T_{B-L} is associated with the $U(1)_{B-L}$ symmetry with a Z' boson.
$$\mathcal{L}_{\mathrm{int}} \sim Z'_\mu \left(\bar{\psi}_L^{\mathrm{SM}} \gamma^\mu (3T_{B-L}) \psi_L^{\mathrm{SM}} \right)$$
$$\sim Z'_\mu \left(\bar{q}_L \gamma^\mu q_L - 3\bar{\ell}_L \gamma^\mu \ell_L \right).$$

so, the full Lagrangian for the Z' boson is

$$\mathcal{L}_{Z'} = -\frac{1}{4} Z'_{\mu\nu} Z'^{\mu\nu} + \frac{1}{2} M_{Z'}^2 Z'_\mu Z'^\mu$$
$$+ \frac{g_{Z'}}{2\sqrt{6}} Z'^\mu \left(\zeta_q^{ij} \bar{q}_L^i \gamma_\mu q_L^j + \zeta_u^{ij} \bar{u}_R^i \gamma_\mu u_R^j + \zeta_d^{ij} \bar{d}_R^i \gamma_\mu d_R^j - 3\zeta_\ell^{ij} \bar{\ell}_L^i \gamma_\mu \ell_L^j - 3\zeta_e^{ij} \bar{e}_R^i \gamma_\mu e_R^j \right),$$
